#### **CSE221**

# Lab Assignment 03 Summer 2023

#### Submission Guidelines:

- 1. You can code all of them either in Python, CPP, or Java. But you should choose a specific language for all tasks.
- 2. For each task write separate python files like task1.py, task2.py, and so on.
- 3. For each problem, take input from files called "inputX.txt" and output at "outputX.txt", where X is the task number.
- 4. Add a hand written explanation of 3-4 lines for each of your solutions in a separate document. You may compile all of your explanations in a single file.
- 5. Finally zip all the files and rename this zip file as per this format:LabSectionNo\_ID\_CSE221LabAssignmentNo\_Summer2023.zip [Example:LabSection01\_21101XXX\_CSE221LabAssignment02\_Summer2023.zip]
- 6. Don't copy from your friends.
- 7. You MUST follow all the guidelines, naming/file/zipping convention stated above.

Failure to follow instructions will result in a straight 50% mark deduction.

## <u>Task 01 [15 Points]:</u>

Somewhere in the universe, the Biannual Regional Alien Competition is taking place.

There are N aliens standing in a line. You will be given a permutation of N, which denotes the height of each alien. A sequence of N numbers is called permutation if it contains all integers from 1 to N exactly once. For example, the sequences [3,1,4,2], [1] and [2,1] are permutations, but [1,2,1], [0,1] and [1,3,4] — are not.

In the competition, for each alien, the judge wants to count how many aliens are standing on its right side with a strictly

smaller height. The judge writes the following code to solve the problem.

```
count = 0
for i in range(n):
   for j in range(i+1,n):
     if H[i] > H[j]:
        count+=1
```

However, their algorithm wasn't efficient at all. Hence, the alien calls you to write a better solution for the program.

More formally, you have to count how many pairs of aliens are standing in the line such that H[i] > H[j] and i < j. Here, A is the permutations of Alience's height. And i,j denotes the Alience's position.

## Input

The first line contains a single integer 1 <= N <=  $10^6$  - the number of total aliens.

The next line contains N integers  $H_1, H_2, \dots, H_n$  (1  $\leq H_i \leq N$ )— the height of the i-th alien. It is guaranteed that the given heights will be the permutation of N.

#### Output

Print a single integer, which denotes the total number of inversions of the given permutation of alien's heights as described in the problem statement.

## Sample Input/Output:

Sample Input 1	Sample Output 1
5 1 2 3 4 5	0
Sample Input 2	Sample Output 2
5 5 4 3 2 1	10
Sample Input 3	Sample Output 3
8 2 7 4 1 5 6 8 3	11

## Sample Input 3 Explanation:

In the sample input 3, the following pairs on alien's heights satisfy the condition: (2,1), (7,4), (7,1), (7,5), (7,6), (7,3), (4,1), (4,3), (5,3), (6,3), (8,3)

## Task 02 [15 points]

You are given a list of integers. You have to choose two indices i and j such that  $A[i] + A[j]^2$  is maximum possible (1 <= i < j <= N, where N is the length of the given list). Here, we are considering 1 based indexing.

Write a code which will find the maximum value of  $A[i] + A[j]^2$  in O(N) or  $O(N \log N)$ .

## Input

The first line contains a single integer 1 <= N <=  $10^6$  - the length of the list.

The next line contains N integers  $A_1$ ,  $A_2$ , .....,  $A_n$  (-10 $^8 \le A_i \le 10^8$ ) separated by a space.

## Output

Print a single integer - which denotes the maximum possible value of  $A[i] + A[j]^2$ .

## Sample Input/Output:

Sample Input 1	Sample Output 1
5 9 6 5 8 2	73
Sample Input 2	Sample Output 2
8 5 10 4 -3 1 6 -10 2	110
Sample Input 3	Sample Output 3
7 -5 -2 -6 -7 -1 8 2	63

## Task 03 [10 Points]

In this problem, you will be given a list of numbers. You have to sort the list using the Quick Sort algorithm in ascending order.

## Pseudocode of Quick Sort Algorithm:

```
QUICKSORT(A, p, r)

1 if p < r

2 q = \text{PARTITION}(A, p, r)

3 QUICKSORT(A, p, q - 1)

4 QUICKSORT(A, q + 1, r)
```

```
PARTITION(A, p, r)

1 x = A[r]

2 i = p - 1

3 for j = p to r - 1

4 if A[j] \le x

5 i = i + 1

6 exchange A[i] with A[j]

7 exchange A[i + 1] with A[r]

8 return i + 1
```

[The code snippet has been taken from the book: Introduction to Algorithms]

#### Input

The first line contains an integer N (1 <= N <=  $10^5$ ), denoting the length of Alice's sorted list. In the next line, there will be N integers separated by space.

#### Output:

You have to sort the number using the Quick Sort algorithm in ascending order and show the sorted list.

## Sample Input/Output:

Sample Input 1	Sample Output 1
8 9 5 4 6 1 3 2 9	1 2 3 4 5 6 9 9
Sample Input 2	Sample Output 2
1 10	10
Sample Input 3	Sample Output 3
6 8 1 4 2 1 3	1 1 2 3 4 8
Sample Input 4	Sample Output 4
7 7 6 5 4 3 2 1	1 2 3 4 5 6 7

## Task 04 [10 Points]

In this problem, you will be given a list of numbers. You have to find the  ${\bf k}$ -th smallest value from the list without sorting using the Partition function of Quick sort.

We will consider the 1 based indexing of the list.

## Input

The first line contains an integer N (1 <= N <=  $10^6$ ), denoting the length of the list.

The next line contains N integers  $A_1, A_2, \dots, A_n$  (  $1 \le A_i \le 10^6$ ) separated by a space.

The third line contains a single integer Q (1  $\leq$  Q  $\leq$  100) - which denotes the number of queries you have to answer.

Each of the next Q lines will contain a single integer K (1  $\leq$  K  $\leq$  N).

# Output:

For each query, you have to find the K-th smallest number from the given list.

# Sample Input/Output:

Sample Input 1	Sample Output 1
9 // Total Elements 10 11 10 6 7 9 8 15 2 4 // Total queries 5 3 2 7	9 7 6 10
